

Kelli

As a whole, this entire class has been quite a learning experience. Before this class, I did not really know that much about computer technology. Now, I am proud to say, that I have created computer animations and have programmed a robot. I loved how I could create many unique projects and could share my work with everyone on the website. I also loved how I was able to work with others in creating exciting projects. I have been to many exciting places and met many interesting people. I loved the field trip to the Spy Museum because I loved the interactive exhibits. In addition, I loved the National Center for Mislabeled and Exploited Children because I enjoyed playing new computer games and I loved being able to give them my opinions on their videos. This class was extremely fun except for when I got stressed out. Because I am not extremely familiar with computer software, I often ran into problems with the programs. In addition, I did not really like the field trip to the Applied Physics Lab because I am not extremely interested in physics and chemistry. The objectives of this class were definitely met because we used technology on a daily basis. We learned how to use many different programs and we applied them to our assignments. We also interacted with our students to create projects together. I would tell students that this class is extremely enjoyable and you learned tons about technology. I would tell them that it is a great experience to partake in interactive projects and to work with others. I would also warn them, though, that the projects can get stressful because technology may not always work the way that you want it to. After this experience, I have learned a lot about college life. I have learned that classes can be very demanding because of all of the work. I have also learned that you have to keep on top of your work in order to be successful in the class. I am now extremely excited for college and I cannot wait to take exciting courses!
