Reflective Journal 1

I feel actually pretty comfortable with the course content. I think that some of the activities will be very helpful to me, since I registered for the educational part of the class. Also, the content of the syllabus is very in depth. It was really overwhelming to find that this much work can be incorporated in three weeks. I think that the fun and exciting activities are LEGO and the Micro Worlds, because I never knew about that type of software. I think that it will be very challenging and also very difficult.

The most exciting thing that I have found so far is the Micro Worlds. I never knew you could have so much fun and use up so much time on this one software. It's so exciting because it incorporates a lot of other software into the programming. Now since I know about this software I'm very compelled to go and purchase it.

What I liked about the classes is that it's very challenging and it's difficult. I like to do a lot of my work under the gun. I like the step up of the class, like the way the computers are displayed. My dislike is the way the room is so hot.

The new things I learned were Micro Worlds, and how to animate a story. Another thing was **constructivist methods for teachers and students**.
